

I honestly think I didn't learn much but how to manipulate and navigate ChatGPT better. I almost feel disengaged when the prompt is "have ChatGPT create..." rather than "create this and use ChatGPT if you get stuck as a tool." It's just very weird to see the evolution of these coding classes that I've taken (on a very basic level) since middle school. It's very night and day from then compared to now.

This was the response that I wrote before I understood the assignment. I thought it was just to have ChatGPT make this code, not to make it and compare my code. So I went back and made my own version of the code. I realized that ChatGPT's code was a lot shorter and did all the things that my code did just with a lot less mess and pointless writing. I learned a few techniques that I will hope to use in the future.
